Agency of American Innovation United States government Federal government departments and agencies increasingly rely on software solutions, instead of manually drafting drawings. According to the U.S. Department of Defense, the \$2.4 trillion the federal government spends on purchasing goods and services, including software, is 12.4 percent of the gross domestic product. The document used by the federal government to measure the economic impact of this spending is called the Economic Impact of the Software Industry, and it reflects software spending. Touro University (New York) St. John's University (New York) The Software Information Industry Association Competitive Analysis: Smartphones and Mobile Devices In this section, the first, second, and third place winners in the race for smartphones and mobile device makers in the United States have been identified. The Apple iPhone's market share dropped slightly in the second quarter of 2012, for the first time in two years. The most recent statistics from the NPD DisplaySearch show that Apple's worldwide market share grew 2.4 percent in the second quarter of 2012. RIM (BlackBerry), however, is beating Apple's market share in the U.S. market in both the second quarter of 2012 and the third quarter of 2012. Microsoft's marketshare decreased in the U.S. during the second quarter of 2012. According to a survey conducted by the NPD DisplaySearch, Google's Android, with a 5.5 percent share, accounted for the most recent growth in smartphone sales. Samsung is the largest producer of both mobile phones and smartphones in the world. This is a guest post by Kevin R. Phinney, Assistant Professor of Product Management at the University of Texas at Austin. If you are reading this, it's likely you are using a mobile device. You may have an Android, iPhone, or Blackberry smartphone or tablet. If you're reading this, then you're part of the future, and we're going to get to the reasons for this, but first, let's talk about what this means. Think of the mobile devices you use as a central nervous system. This is a way to illustrate how people are physically and mentally affected by the devices. It is also a way to understand why

In AutoCAD, the element type of a line is either text, hatch, or path. The hatch type is a line with alternating perpendicular, horizontal, or oblique lines drawn between them. There are 3 types of hatch, called "organizing hatch types". These are regular hatch, zigzag hatch, and dotted hatch. Text and regular hatch are described in more detail in the help file under the section on "hatch". A regular hatch is composed of parallel perpendicular lines, usually two, with the lines' openings facing outward or inward depending on the direction of the last line drawn in the hatch. A zigzag hatch is similar to a regular hatch but contains alternating lines going in the direction opposite to the direction of the last line. A dotted hatch is composed of lines that are either perpendicular, parallel, or diagonal. If a line in a dotted hatch is perpendicular to the last line drawn, it is called an "X-hatch"; if it is parallel to the last line, it is called a "Y-hatch"; and if it is diagonal to the last line, it is called a "Z-hatch". Text is a line that contains no other line information. AutoCAD supports a number of clip objects, which are used to create a temporary box around a set of objects so that it can be edited as a unit. This includes the command-line command clip or the keyword. The command clip uses the names of the objects that it should be applied to, and the keyword uses the name of the object or objects on the command line. A user can create an empty clip by choosing a suitable name for the clip, clicking the clip button, and specifying an area of space in which the clip should be applied. The existence of views means that a user can view any part of the screen in any other way. In the example of an architectural plan, a user may wish to view the entire plan from a top-down perspective. Alternatively, the user may wish to view the plan zoomed in to a particular part, such as the area around a particular floor or the section of a particular wall, or to view the plan at a particular resolution. Rendering Renderings are the outputs produced by the 2D drawing programs (AutoCAD and AutoCAD LT). These are raster images of the 3D object represented in 2D format. They have been developed for 3D printing as well as for other physical reproductions.

prev=nnf-chapter5.html ~~~~~ Replacing Nodes =====
[[gwucncnd]][[replacing-nodes]] Replacing Nodes ----- In this chapter,
we will describe how to replace the current node with a new node when it is the
root node. First, we will define the mechanism that will be used in the later
chapters to replace the nodes in the subtree, then we will describe the two
procedures that will be used to replace a parent node and a child node.
